

Can We Use Models to Predict Vaginal Birth After Cesarean Delivery?

Torri Metz, MD
Associate Professor
Maternal-Fetal Medicine
January 11, 2019

Disclosure Statements

- I have no relevant financial relationships to disclose or conflicts of interest to resolve

Learning Objectives

- Describe trends in VBAC versus elective repeat cesarean
- Counsel women regarding risks and benefits of VBAC
- Utilize VBAC models to predict success
- Incorporate prediction models into VBAC counseling

Background

- TOLAC offered to women with history of cesarean delivery
- Decision-making regarding mode of delivery dependent on several factors
 - Availability of TOLAC
 - Weighing risks and benefits
 - Obstetrical history
 - Patient preference

Trends in VBAC Over Time

Figure 1 Total and primary cesarean rate, 1970 to 2004, and VBAC, 1985 to 2004. (Source: Data for 1970–1988 are from the National Hospital Discharge Survey [NHDS]. Data for 1989–2004 are from the National Vital Statistics System. For 1989 the estimate of the total cesarean rate from the NHDS was 23.8 percent; the estimate from vital records was 22.8 percent. Data for 2004 are preliminary.)

Trends in VBAC Over Time

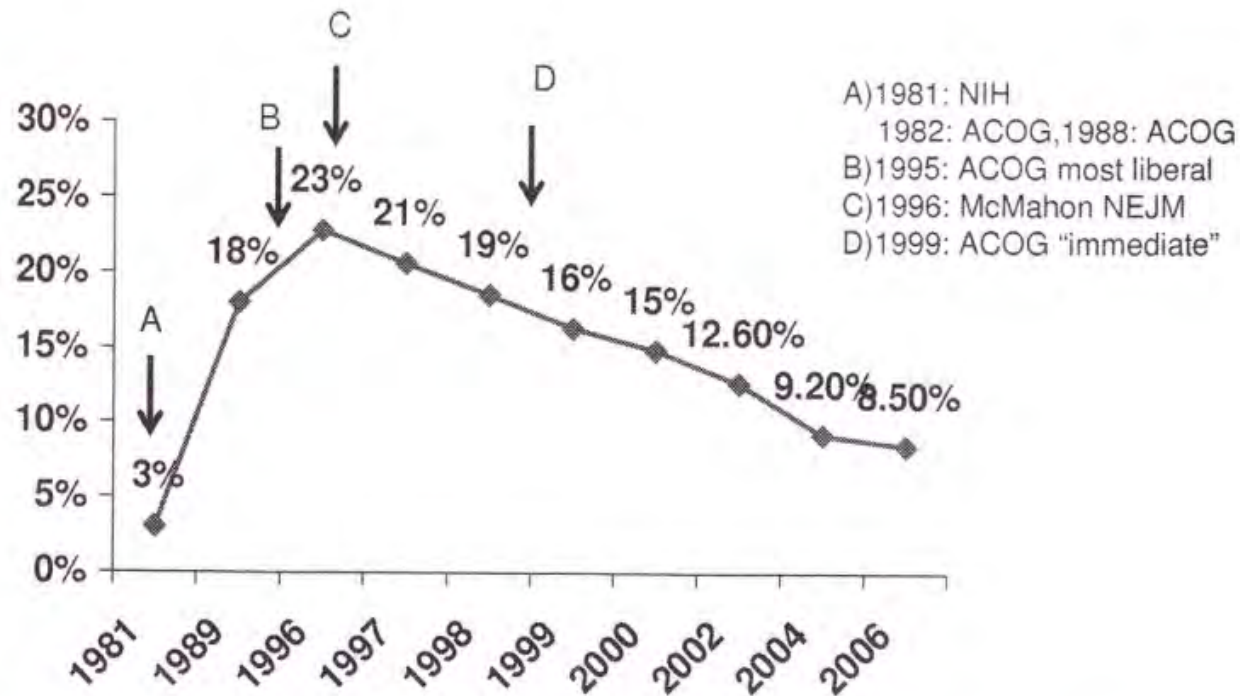

Figure 1 Trends in VBAC rates since 1981 NIH Consensus Conference on cesarean childbirth with timeline of external events impacting VBAC rates. (Reprinted with permission.^{24,25}) (Color version of figure is available online.)

Contributors to Decreased TOLAC

- Reports of uterine rupture
- Medico-legal concerns
- Difficulty in providing/understanding ACOG's "immediate availability"
- No TOLAC
 - 1/3 of hospitals
 - 1/2 of obstetricians

**How do we weigh
the risks and
benefits of
TOLAC?**

Accreta, Uterine Rupture and Failed TOLAC, oh my...

Placenta Accreta

Placenta Accreta: Morbidity

- Blood transfusion $\geq 80\%$
 - ≥ 4 units in 40%
- Large volume blood loss
- Cystotomy (bladder injury)
- Ureteral injury
- ICU admission: 25 – 50%
- Re-operations
- Vesico-vaginal fistulas

Placenta Accreta

Incidence

- 1960s: 1 in 30,000 deliveries
- 1985 – 1994: 1 in 2,510 deliveries
- 1982 – 2002: 1 in 533 deliveries
- Correlation with rising cesarean rate
- Most common indication for cesarean hysterectomy in developed countries

Miller et al., AJOG 1997;177:210

Wu et al., AJOG 2005;192:1458

Accreta

CS#	N	Accreta
1	6,195	15 (0.2%)
2	15,805	49 (0.3%)
3	6,326	36 (0.6%)
4	1,457	31 (2.1%)
5	260	6 (2.3%)
≥ 6	89	6 (6.7%)

Placenta Previa and Accreta

CS#	Placenta Previa	Placenta Accreta
1	397	13 (3.3%)
2	212	23 (11%)
3	72	29 (40%)
4	33	20 (61%)
5	6	4 (67%)
≥ 6	3	2 (67%)

Utah Data with Multidisciplinary Care Team

- Estimated blood loss 2 liters
- Admission to ICU 43%
- Coagulopathy 29%
- Blood transfusion of ≥ 1 unit 82%
- Blood transfusion of ≥ 4 units 43%
- Ureteral injury 6%
- Median length of stay 5 days

**Why not offer
everyone a
TOLAC?**

Trial of Labor vs. Repeat CS

3,249 TOL versus 2,889 ERC

- **Minor complications (6.3 vs 7.6%)**
 - Puerperal fever, transfusion, infection
 - No significant differences
- **Major complications (1.6 vs 0.8%)**
 - Hysterectomy, uterine rupture, operative injury
 - Twice as likely in TOL group

Uterine Rupture

MFMU TOLAC Study

- 4-year prospective observational trial
 - MFMU Network (19 centers)
 - 1 prior LTCS, singleton pregnancy
 - TOLAC (17,898) vs. RCS (15,801)
- Neonatal data
 - NICU admission
 - Morbidity at discharge and up to 120 days of life

Landon, et al, NEJM 2004; 351:2581-9

Demographics

	TOL (17,898)	ERC (15,801)	<i>P Value</i>
Maternal age	28.7±6	29.9±6	<0.001
Married	9,854	10,437	<0.001
BMI	31.9±7	33.5±7	<0.001
Prior VD	50%	16%	<0.001
Prior VBAC	34%	16%	<0.001
Maternal disease	18%	22%	<0.001

Landon, et al, NEJM 2004; 351:2581-9

Maternal Outcomes

	TOL (17,898)	ERC (15,801)	<i>P</i> value
Uterine rupture	124 (0.7%)	0	<0.001
Hysterectomy	41 (0.2%)	47 (0.3%)	0.22
Thrombosis	7 (0.04%)	10 (0.1%)	0.32
Transfusion	304 (2%)	158 (1%)	<0.001
Endometritis	517 (3%)	285 (2%)	<0.001

Adjusted OR: Maternal Complication 2.0 (1.7, 2.2)

Perinatal Outcomes and Uterine Rupture

Uterine rupture	N=114	
Intrapartum stillbirth	0	0%
HIE	7	6%
Neonatal death	2	2%

TOLAC vs ERCD

- RCTs are lacking and not feasible
- Propensity analysis
 - Rates of endometritis, operative injury, RDS, newborn infection lower with ERCD
 - Rates of hysterectomy and wound complication higher with ERCD
 - 62 (95% CI 40-138) women would need to undergo ERCD to prevent one adverse maternal outcome
 - 43 (95% CI 29-78) women would need to undergo PRCD to prevent one adverse neonatal outcome

Failed Versus Successful TOL

	Fail (1287)	Success (1962)	OR
Minor	9.3%	4.3%	1.5*
Fever	3.8%	0.2%	5.1*
Major	3.8%	0.2%	5.1*
Uterine rupture	0.6%	0.1%	3.7*
Operative Injury	3.0%	0.1%	5.1*
All complications	13.1%	4.5%	5.1*

Failed Versus Successful TOLAC

	<u>Fail (4759)</u>	<u>Success (13139)</u>	<u>OR</u>
Uterine rupture	2.3%	0.1%	22 (13,39)
Hysterectomy	0.5%	0.1%	3 (1.7,5.9)
Thromboembolism	0.1%	0.02%	NS
Endometritis	7.7%	1.2%	7.1 (5.9,8.6)
One or more comp	14.1%	2.4%	6.8 (5.9,7.8)

Landon, et al, NEJM 2004; 351:2581-9

Successful VBAC

Is better than

Scheduled Elective Repeat CS

Is better than

Failed TOLAC with Emergency CS

**How do we
choose good
candidates for
TOLAC?**

General Counseling TOLAC

- Success rates 60–80%
- Individual variation
- Strong predictors of success
 - Prior vaginal birth
 - Spontaneous labor

General Counseling TOLAC

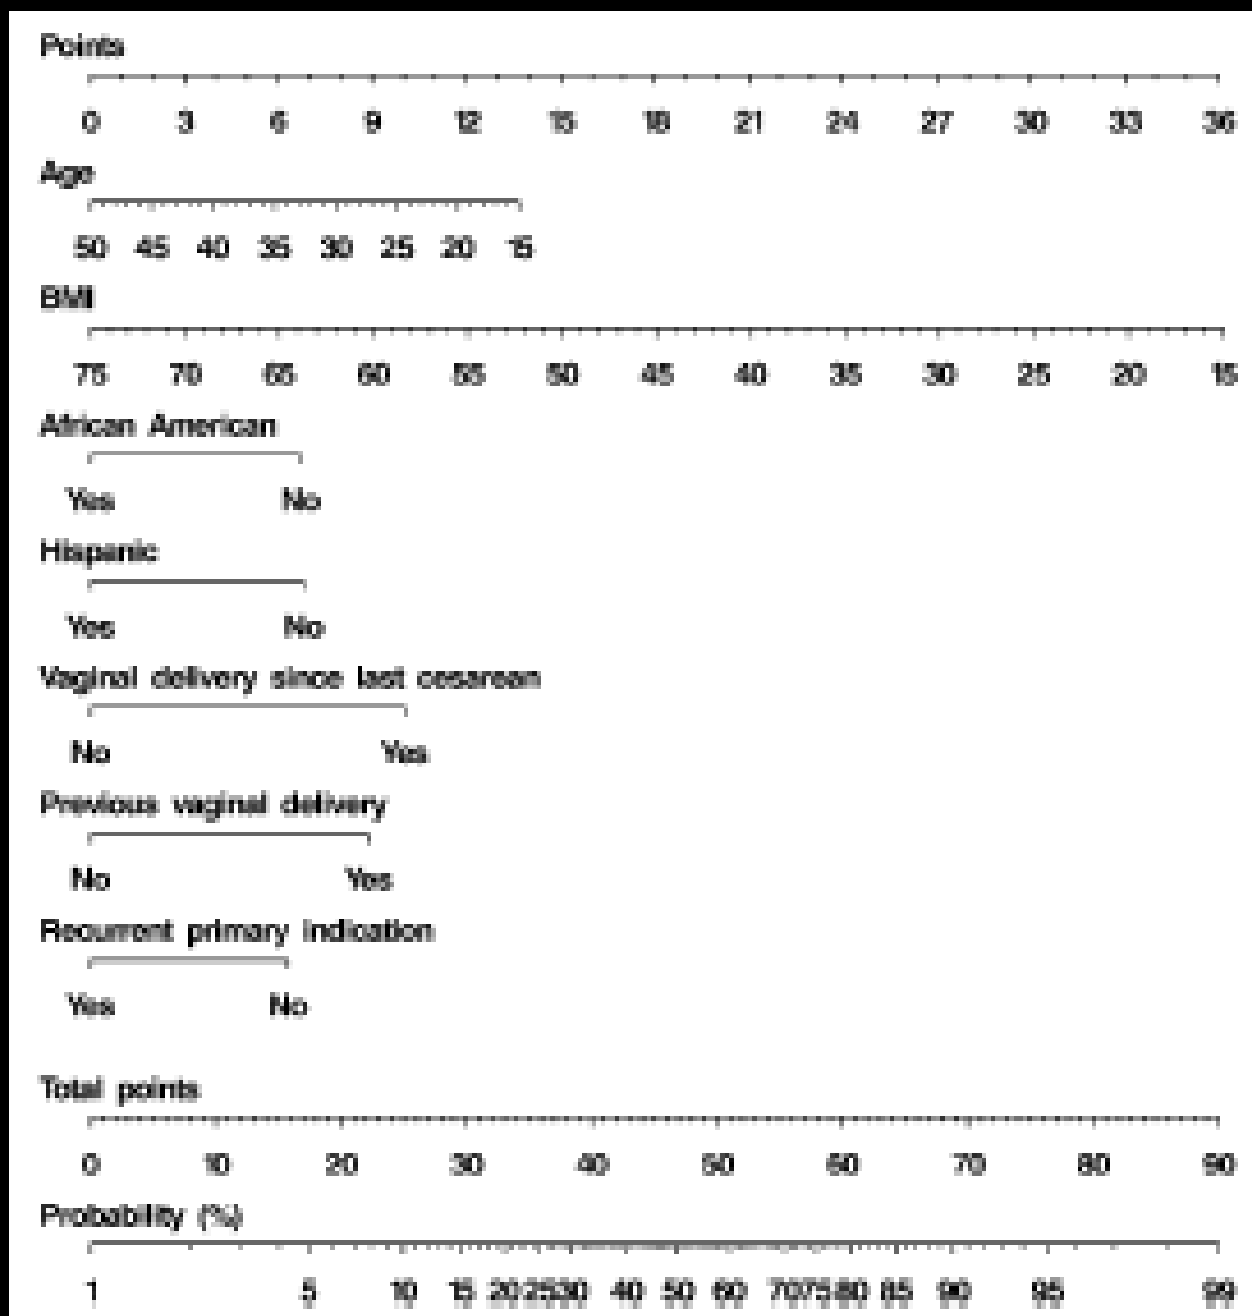

- Predictors of decreased success
 - Recurrent indication for CS (dystocia)
 - Increased maternal age
 - Non-white ethnicity
 - ≥ 40 weeks gestation
 - Maternal obesity
 - Preeclampsia
 - Short inter-pregnancy interval
 - Increased neonatal birth weight

VBAC

Calculators

MFMU Prenatal VBAC Calculator

- 11,856 (73%) prospective cohort delivered vaginally
- Multivariable logistic regression to identify factors associated with successful VBAC
- Factors weighted and nomogram created
- AUC 0.75 (95% 0.74-0.77)

Case Examples

MFMU VBAC Calculator

The screenshot shows a Google search for "mfm vbac calculator". The browser's address bar shows the search URL. The Google search bar contains the text "mfm vbac calculator". Below the search bar, the "All" tab is selected. The search results show "About 857 results (0.35 seconds)". The first result is "Vaginal Birth After Cesarean - MFMU Network" with a link to <https://mfmunetwork.bsc.gwu.edu/PublicBSC/MFMU/VGBirthCalc/vagbirth.html>. The description states: "This calculator is based on the equation published in the article 'Development of a nomogram for prediction of vaginal birth after cesarean' cited below." The second result is "delivery - MFMU Network" with a link to <https://mfmunetwork.bsc.gwu.edu/PublicBSC/MFMU/VGBirthCalc/vagbrth2.html>. The description states: "This calculator is based on the equation published in the article 'Does information available at the time of admission for delivery improve prediction of successful ...'". The third result is "Vaginal Birth After Cesarean (VBAC) Risk Calculator | AHRQ Health ..." with a link to <https://innovations.ahrq.gov/.../vaginal-birth-after-cesarean-vbac-risk-calculator>. The description states: "Apr 10, 2013 - Vaginal Birth After Cesarean (VBAC) Risk Calculator ... and Human Development (NICHD) Maternal-Fetal Medicine Units Network (MFMU).". Below the search results, there is a "People also ask" section with the question "How can I increase my chances of a VBAC?". The Windows taskbar at the bottom shows the search bar, taskbar icons for various applications, and the system clock displaying "11:02 AM 11/8/2018".

American Journal of Perinatology, volume ???,

Time of Admission VBAC Score

- 5,445 women at 8 hospitals
- 1,170 (21.5%) underwent TOLAC
 - 938 (80%) had a successful VBAC
- Multivariable logistic regression model
- Weighted variables remaining in model
- VBAC score
 - Bishop score at admission
 - Add points for: history of vaginal birth, age <35 yrs, absence of recurrent indication, BMI <30

VBAC Score

Box 1. Calculation of Integer Vaginal Birth After Cesarean Score

Calculate the Bishop score using the cervical examination at the time of admission

Add 4 points for history of vaginal delivery

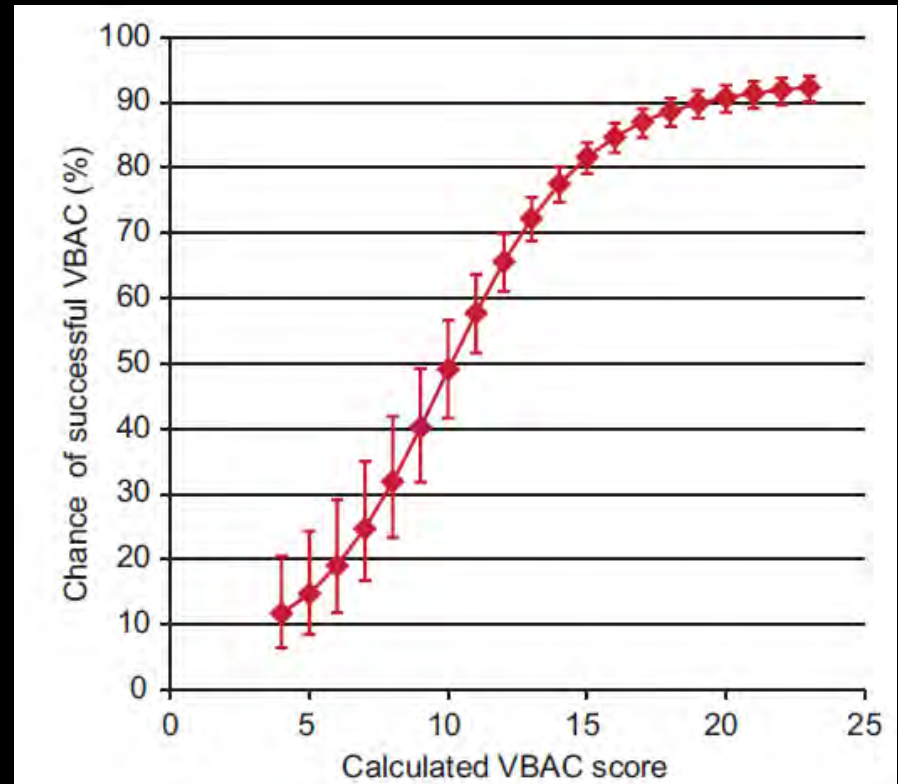

Add 2 points if prepregnancy body mass index is less than 30

Add 3 points if primary cesarean delivery was not because of a recurring indication

Add 2 points if maternal age at the time of delivery is younger than 35 years

Sum total score

AUC 0.80 (95% CI 0.76-.84)

**What about
women with 2
prior cesareans?**

Maternal Outcomes, 2 Prior CS

	1 CS (12,535)	2 CS (1,082)	Adj RR
Uterine rupture	0.9%	1.8%	2.3
Bladder injury	0.43%	0.55%	NS
Transfusion	0.68%	0.92%	NS
Fever	9.5%	8.9%	NS
Operative injury	0.99%	1.02%	NS
Composite morbidity	2.12%	3.23%	1.61

Macones, et al, AJOG 2005; 192:1223

TOLAC with Two Prior CS

- 975 women with ≥ 2 CS and TOLAC—66% success rate
 - Rupture 0.9% (2 prior CS)
 - No increase in rupture ($p=0.37$)
 - 0.6% risk of hysterectomy (0.2%)
 - 3.2% risk of transfusion (1.6%)
 - Composite maternal morbidity
 - 1.41 (1.02 – 1.93) – low absolute risk

Landon, et al, Obstet Gynecol 2006; 108:12

TOLAC with Two Prior CS

- Systematic review and meta-analysis
- No RCTs – 20 studies
- Success rates – 71.1%
- Rupture rates – 1.36%
- Maternal morbidity of VBAC after 2 prior CS similar to RCS with 2 prior CS

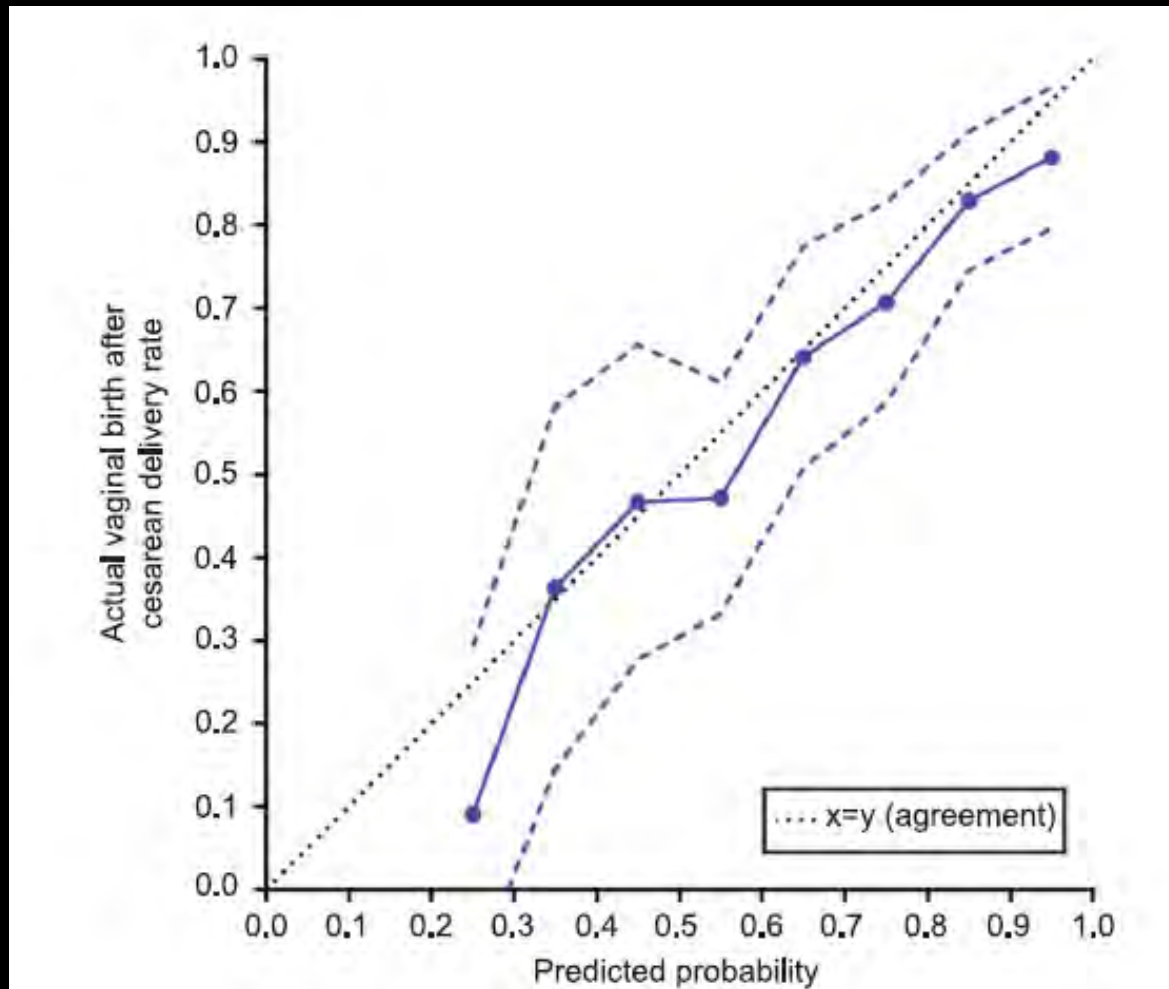

TOLAC with Two Prior CS

- Systematic review and meta-analysis
- 5 observational cohort studies of uterine rupture
- Women with one prior CS were at lower risk of rupture than two prior CS
 - 0.72% versus 1.59% (OR 0.42, 95% CI 0.29-0.60)

MFMU Model with Two Prior CS

- 369 women with two prior CS in MFMU Cesarean Registry
- Actual VBAC rate 66% (95% CI 61-71)
- Utilized MFMU prenatal care model
- Women with an arrest diagnosis as indication for either CS were considered 'yes' in model
- AUC 0.74 (95% CI 0.69-0.80)

MFMU Model with Two Prior CS

Preterm VBAC Model

- 1295 women undergoing TOLAC
- Gestational age 26w0d to 36w6d
- VBAC rate 76.6%
- Multivariable prediction model
 - Factors increasing success: diabetes, greater cervical dilation, history of vaginal birth/VBAC
 - Factors decreasing success: induction, recurring indication for cesarean, hypertensive disease
- AUC 0.80 (95% CI 0.77-0.83)

Predicting Morbidity with Models

- Prospective cohort 13,500 candidates for TOLAC
- Stratified by likelihood VBAC MFMU Calculator
- Women with >70% likelihood of success had similar morbidity to those undergoing ERCD (RR 0.80, 95% CI 0.5-1.2)
- Women with <70% likelihood of success had increased risk maternal morbidity (RR 2.2, 95% CI 1.5-3.1)

Predicting Morbidity with Models

- Retrospective cohort 8,505 candidates for TOLAC
- Maternal morbidity similar between TOLAC and ERCD groups when predicted probability of success $\geq 60\%$ (RR 0.8, 95% CI 0.6-1.1)
- Maternal morbidity higher when predicted probability $< 60\%$ (RR 2.3, 95% CI 1.4-4.0)
- Neonatal morbidity similar when predicted probability $\geq 70\%$

Good Candidates

- Best chance of success
- Least risk of rupture
- Most women with 1 (or two) CD
- Not classical CD, previa, etc.
- Poor candidate may be OK if advanced labor

Shared Decision-Making

- Pilot study 25 women
- Tool incorporating education about risks and benefits of TOLAC plus calculator with likelihood of success
- Small proportion of women identified a predicted likelihood of success below which they would not attempt VBAC

Shared Decision-Making!

- Availability of TOLAC
- Probability of successful VBAC
 - Incorporate VBAC models
- Significance and estimated frequency of complications with TOLAC and ERCD
- Patient's personal values, preferences, future pregnancy plans

Thank you!
